We'd like to receive MaxLoad[®] 3.6 but are not sure about our MVP status. Please contact us with phone/email provided above.

Fax this form to 972.739.9478

MaxLoad 3.6 Summary

- Create new L-shaped SKUs
- View individual SKU placement among wire frames
- Create specific SKU bundles and arrangement
- Use Multiple Mixed Pallets in one calculation
- Load individual Stop-offs with different priorities
- Easily locate empty spaces in containers for dunnage materials
- View different stop-offs in distinct colored reports
- Adjust the distribution of weight by moving the load
- Set weight limits and restrictions per region
- Build customized load and summary print reports
- Create and define different load rules to refine load solutions
- Easily add, update, and edit SKUs in the manifest list
- Advance data filter for easy file organization
- Export load diagram to graphics or pdf file

Do you know...

The standard MaxLoad uses Microsoft Access as the back end database but it also supports high performance database servers including SQL and Oracle. This option allows large amount of data to be stored in one central location and enable high volume transactions to take place without any data corruption.

You might want to consider upgrading to the SQL/Oracle version if you are seeking an enterprise wide solution to load planning, with massive data already resides in ODBC-compliant database management systems.

Call 972.739.8677 for a quote to upgrade to MaxLoad SQL version.
